

Abstract: Provide a low-cost, high quality software development mechanism for the creation of education specific solutions for the tertiary education sector in Australia.

Custom "Education-Specific" Software Development

Service Description: NPS Consulting Group can offer a variety of different education providers the option of developing customized IT solutions using highly experienced consulting professionals with specific education IT experience. Through the use of an offshore development house we can do this in a very cost competitive environment while still offering a high quality end product.

The typical process is to use our own expert project managers, business analysts and software engineers to work closely with you, the customer, to develop a list of requirements and then a technical design specification. Following your acceptance and sign-off of the design document we then distribute this to our offshore development partner who immediately sets to work on the development.

Upon completion of the software development phase we fully quality assure and test the software prior to installation on your site. Our consultants can then provide you with training and full product documentation.

Skill Sets: Please note that most, if not all, common development toolsets can be catered for (in addition to which we can provide advice on selection of the appropriate technical environment, including hardware specification). Our development partner has a team of more than 500 trained software development experts that we can utilize.

Cost: Rates up to 80% less than many competitors.

Quality: We guarantee the outcome after sign-off of the design specification.

Quotations: No cost / no obligation.
